- Universities and institutes
- Strategic partnerships

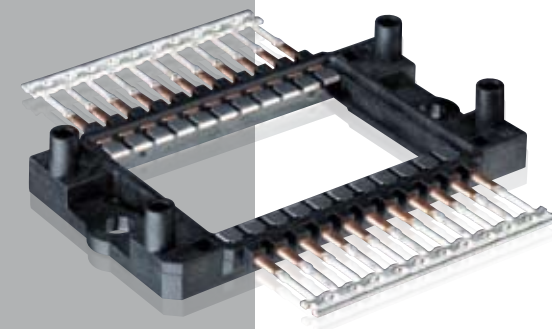

Advance developments.

Increasing product demands as benchmark

For almost 6 decades the name Cetto stands for innovative solutions of the supply industry of polymer processing. We face the continuously increasing demands on our sector – predominantly consisting of medium sized businesses – in terms of technology, quality, costs, logistics and globalisation by constant dialogue with developers, universities, machinery manufacturers and polymer suppliers.

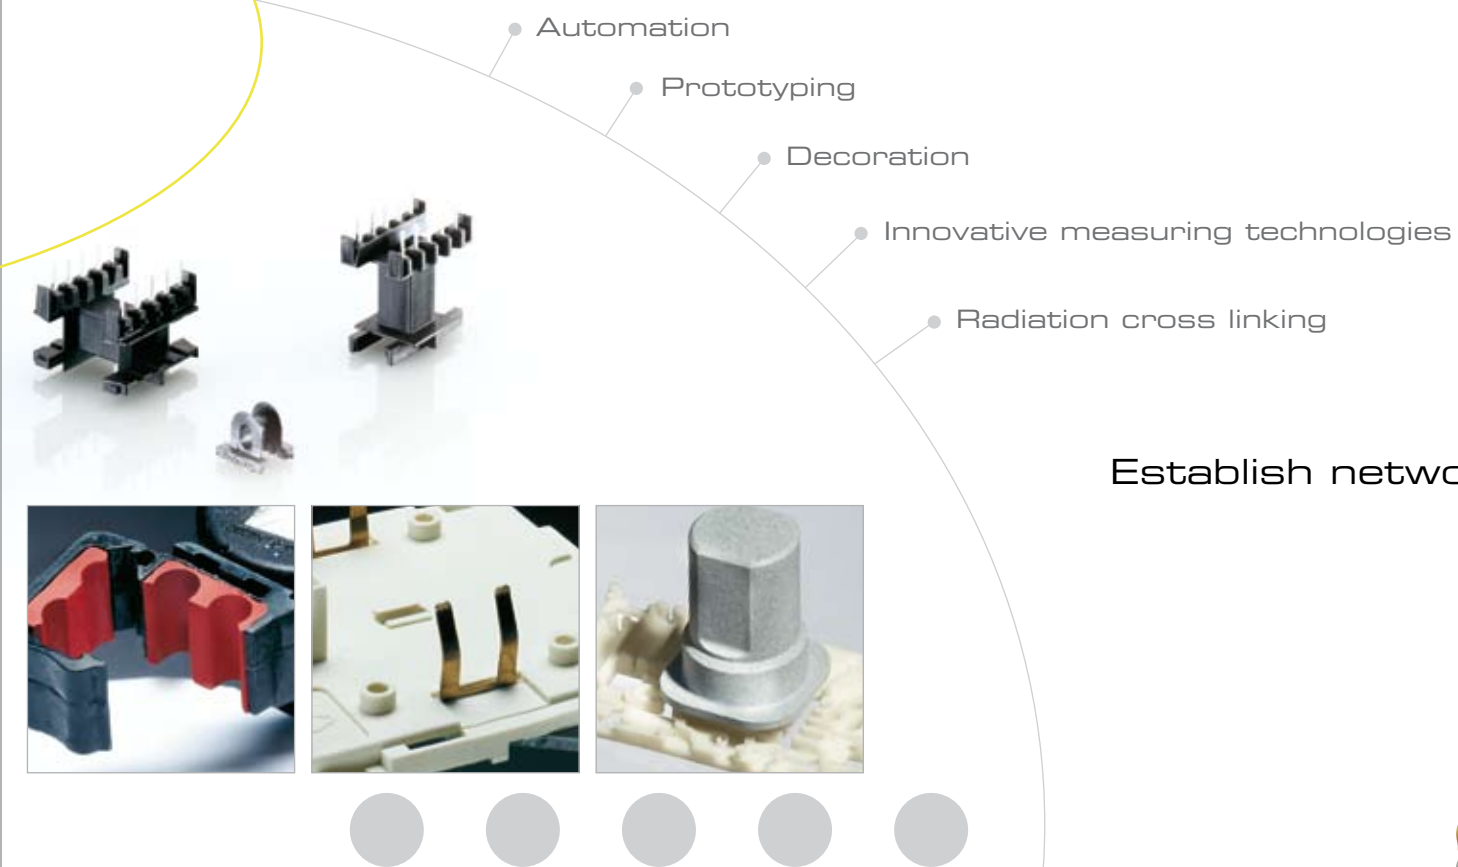

The positive development of the cetto-group shows that our strategic alignment was successful. Cetto is today able to offer a substantially larger spectrum of technologies and services, through the expansion of the know-how within the company and the development of intelligent networks, which comprehensively exceed mere injection moulding technology.

Cooperation under the sign of innovative future solutions

As cetto-group we are the strong supplier of international customers. We offer therefore know-how from one source. We cooperate throughout Europe with efficient partners to be able to bring innovative solutions to the market quickly. In the automotive industry for example more innovations were introduced than ever before in the past 10 years.

We face these circumstances with strategic partnerships, in which we bundle our know-how in terms of polymer and tool making technology with key personnel from synergetic technology areas. Examples of this are strategic partnerships like the cluster "Sensorik Bavaria" but also joint ventures like our „KH-Cetto sro.“ in the Czech Republic.

Establish networks.

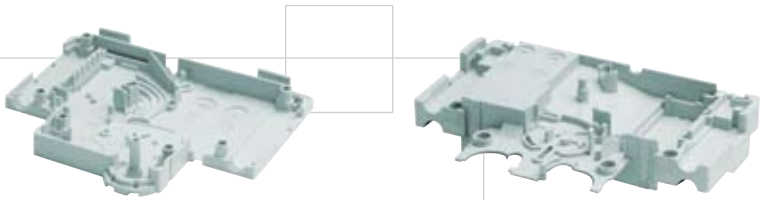

- In-Mold-Decoration IMD
- Prototyping
- 2K/3K manufacturing
- Support development
- Robotics
- Automation

Innovation as a guide
towards the future

Besides strategic partnerships we have successfully established an effective network to remain also a pace-maker of innovative solutions for polymer components, decorative applications, complex polymer systems or also polymer-metal components and to fulfil the expectations of our customers in the future.

With this we also cover a comprehensive service spectrum of internal and external tool making technology in the interest of demanding manufacturing technologies. Included in this are also automations, surface refinements and radiation cross linking. Also the know-how transfer with other businesses of the sector or with universities and institutes provides us with decisive advantages – very much in the interest of our customers.

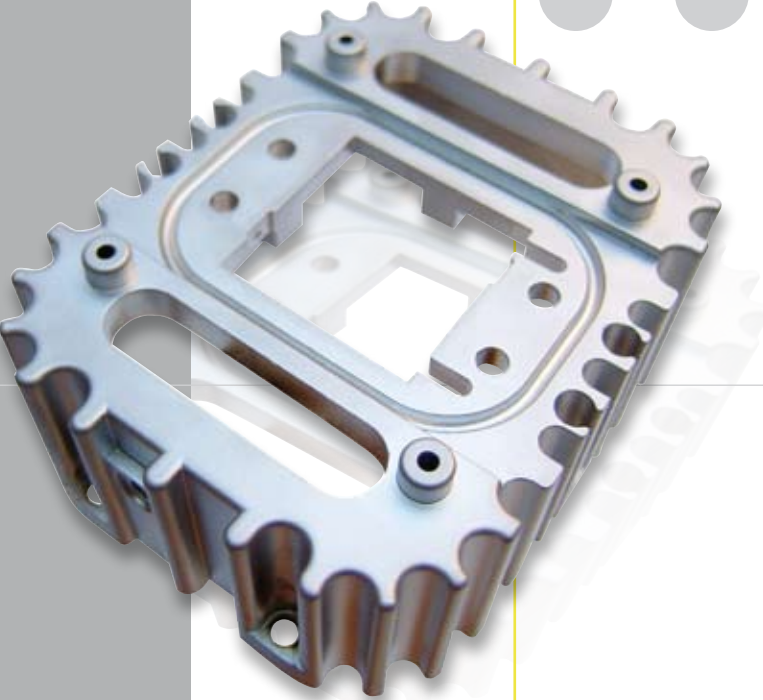

systematic success.

Pointing the way – in series.

- Manufacturing of pilot series

Our continuous project management develops optimisation potentials

Our main products are applied in the two market segments automotive and electronics. Some years ago we had already succeeded in taking the decisive step from pure parts manufacturer to component and system supplier.

One of many examples is solutions for vehicle access systems. Here again the excellent quality and a convincing price/performance ratio as well as “time-to-market” play the decisive roles.

Continuous project management with only one contact through the entire development and realisation phase is the success factor here and a substantial emphasising feature in comparison to many competitors.

- Insert moulding
- Galvanisation
- Lacquering
- Laser welding
- Ultrasonic
- Electrical inspections

Holistic solutions - turnkey ready.

Trend-setting

Besides the economical approach we regard the ecological alignment of our development and manufacturing process a strategic target for the coming years. Besides the energy management, which was already introduced some time back, above all we can refer with pride to the co-development of hybrid technologies or interesting approaches for the use of biodegradable raw materials, additives and fuels.

We generate the products for your success

To develop new system solutions for constantly increasing demands by our supply industry always requires new ideas and increasing know-how.

On the one hand a large potential of development achievements, manufacturing knowledge as well as system solutions are requested, on the other speed, quality and of course profitability matter.

2K-/3K-technology

Joining techniques

Over moulding technology

Surface coatings

Product refinement

Packaging

Know-how and visions.

Mid-sized flexibility with industrial capacity

The idea always comes before the innovation. We achieve impressive results, implemented with a lot of knowledge and experience. Our flat hierarchies and fast decision making channels help to find efficient and cost optimised solutions in the interest of our customers.

From planning up to JIS/JIT – delivered system solutions the close cooperation with our customers during the development phase achieves real product advantages.

As well as during the manufacturing phase this is also shown during the concept phase by checking feasibility, efficiency, material selection or searching for savings potentials. Our solutions fulfil the constantly increasing product requirements for ecological compatibility, functionality, smallness or complexity. As a flexible partner we convert this knowledge quickly and efficiently into quantities.

Inspection for leaks
Optical inspection
(with the aid of camera system)
International tool procurement
Mould flow / FEM analysis
Laser

Deliver system solutions – worldwide.
